

Heat Transfer Practice

1) When a 200.0 g, 100.0°C piece of metal was dropped into a cup containing 150.0 ml of 20.0°C water. The temperature of the water rose to 22.0°C. What is the specific heat of the metal? Evaluate using significant figures.

HOT metal	LESS HOT water
<p><i>We expect this to be small</i> → $c = ?$</p> <p>$m = 200.0\text{g}$</p> <p>$\Delta T = 22^\circ\text{C} - 100^\circ\text{C}$</p> <p>$\Delta T = -78^\circ\text{C}$</p>	<p>$m = 150.0\text{g}$</p> <p>$c = 4.19\frac{\text{J}}{\text{g}^\circ\text{C}}$</p> <p>$\Delta T = 22^\circ\text{C} - 20^\circ\text{C}$</p> <p>$= 2^\circ\text{C}$</p> <p>$Q_{\text{water}} = mc\Delta T$</p> <p>$= (150.0\text{g})(4.19\frac{\text{J}}{\text{g}^\circ\text{C}})(2^\circ\text{C})$</p> <p>$= 1257\text{J}$</p>

metal water

$-Q = Q$

$(-200.0\text{g})c(-78^\circ\text{C}) = 1257\text{J}$

$c = \frac{1257\text{J}}{(200\text{g})(78^\circ\text{C})}$

$c = 0.0806\frac{\text{J}}{\text{g}^\circ\text{C}}$

2) A hot poker is made of tin (0.228 J/g°C), it has a mass of 2.5 kg. In order to lose some heat it is placed in 1500 mL of water, which has a temperature of 15°C, the final temperature reaches 19°C. What was the initial temperature of the poker?

HOT poker	LESS HOT water
<p>$m = 2500\text{g}$</p> <p>$c = 0.228\frac{\text{J}}{\text{g}^\circ\text{C}}$</p> <p>$\Delta T = ?$</p> <p><i>* We expect the metal to have a high T_i *</i></p>	<p>$m = 1500\text{g}$</p> <p>$c = 4.19\frac{\text{J}}{\text{g}^\circ\text{C}}$</p> <p>$\Delta T = T_f - T_i$</p> <p>$= 19^\circ\text{C} - 15^\circ\text{C} = 4^\circ\text{C}$</p> <p>$Q_{\text{water}} = mc\Delta T$</p> <p>$= (1500\text{g})(4.19\frac{\text{J}}{\text{g}^\circ\text{C}})(4^\circ\text{C})$</p> <p>$= 25,140\text{J}$</p>

poker water

$-Q = Q$

$-(2500\text{g})(0.228\frac{\text{J}}{\text{g}^\circ\text{C}})\Delta T = 25,140\text{J}$

$\Delta T = \frac{25,140\text{J}}{(-2500\text{g})(0.228\frac{\text{J}}{\text{g}^\circ\text{C}})}$

$\Delta T = -44.105^\circ\text{C}$

$T_f - T_i = -44.105^\circ\text{C}$

$19^\circ\text{C} - T_i = -44.105^\circ\text{C}$

$T_i = 63.1^\circ\text{C}$

3. A hot metal is placed in 100.0 mL, of 25.0°C water. The initial temperature of the metal is 95.0°C and it reaches a final temperature of 27°C. The specific heat of the metal is 0.454 J/g°C. What is the mass of the metal?

HOT metal	LESS HOT water
<p>$m = ?$</p> <p>$c = 0.454\frac{\text{J}}{\text{g}^\circ\text{C}}$</p> <p>$\Delta T = T_f - T_i$</p> <p>$= 27^\circ\text{C} - 95^\circ\text{C}$</p> <p>$= -68^\circ\text{C}$</p>	<p>$m = 100.0\text{g}$</p> <p>$c = 4.19\frac{\text{J}}{\text{g}^\circ\text{C}}$</p> <p>$\Delta T = 2^\circ\text{C}$</p> <p>$Q_{\text{water}} = mc\Delta T$</p> <p>$= (100.0\text{g})(4.19\frac{\text{J}}{\text{g}^\circ\text{C}})(2^\circ\text{C})$</p> <p>$= 838\text{J}$</p>

metal water

$-Q = Q$

$-m(0.454\frac{\text{J}}{\text{g}^\circ\text{C}})(-68^\circ\text{C}) = 838\text{J}$

$m = \frac{838\text{J}}{(0.454\frac{\text{J}}{\text{g}^\circ\text{C}})(68^\circ\text{C})}$

$m = 27.1\text{g}$

4. Platinum-gold alloys are often used in the production of fine jewellery. The alloys are 90% by mass platinum and 10% by mass gold (how to deal with this in problem: make up any numbers for mass that have the same ratio ex. 90 g for platinum and 10 g for gold). During the fabrication of the alloy, the two metals are heated separately to a temperature that exceeds their melting points by 100.0°C and are then mixed.

Consider the following information and assume that no heat is lost to the surroundings.

Property	Platinum	Gold
Melting point (°C)	1768	1064
Specific heat capacity (J/g°C)	0.1300	0.1300

What is the final temperature of the mixture?

A) 1798°C

C) 1516°C

B) 1698°C

D) 1416°C

HOT	LESS HOT
Platinum	Gold
$m = 9g$	$m = 1g$
$c = 0.1300 \frac{J}{g^\circ C}$	$c = 0.1300 \frac{J}{g^\circ C}$
$\Delta T = ?$	$\Delta T = ?$
$T_i = 1868^\circ C$	$T_i = 1164^\circ C$

*We expect the final temp. to be closer to that of platinum because they have the same heat capacity and platinum has the larger mass in the alloy

Platinum Gold \rightarrow Cancel specific heat Same on both sides

$$-Q = Q$$

$$(-9g) \left(0.1300 \frac{J}{g^\circ C}\right) \Delta T = (1g) \left(0.1300 \frac{J}{g^\circ C}\right) \Delta T$$

$$\frac{-9g \Delta T}{1g} = \frac{1g \Delta T}{g}$$

$$-9 \Delta T = \Delta T$$

$$-9(T_f - 1868^\circ C) = T_f - 1164^\circ C$$

$$-9T_f + 16812 = T_f - 1164^\circ C$$

$$\frac{17976}{10} = \frac{10T_f}{10}$$

$$T_f = 1797.6^\circ C$$

(A)
